Ruslan Dudnikov

Senior Unity Developer

Summary

- 8 years of **commercial** software development experience (since April 2018).
- 16 commercial projects.
- Expertise and professional interest in:
  - Mobile and desktop game development and applications
  - VR experiences and games
- Key experience with:
  - Unity (UI, Addressables, SDK, Unity Editor Tools, Prefabs, Localization, Analytics, Profiling, Optimization, Refactoring)
  - C#
  - Git
  - Client-server communication

General Information

Languages:
English – B2 (reading/writing/speaking)
Polish – B1 (reading/writing/speaking)
Russian – Native

Code examples:
SuperScane Unity Assignment (August 2024)
SpaceX Test Task (September 2020)

Projects

Project #15, #16 — Bingo Bling — Solitaire Stash

Period: August 2022 – October 2026
Role: Senior Unity Developer
Tech Stack: C#, Unity 3D, Jira, Confluence, Git (BitBucket), Addressables, CI/CD (Bitbucket), Figma, Miro, AI (agents: Kiro, Claude, Codex) with Unity MCP, ECS.
Description: Bingo Bling, Solitaire Stash (gmstry.com).

Responsibilities:

- major features development;
- preparing release candidates, post publishing review;
- release incidents resolving;
- release major bugs fixing;
- client-server architecture improvements;
- Addressables and backward compatibility management;
- manual testing;
- planning and estimating;
- designing architecture solutions;
- contributing into team workflow;
- code-review;
- documenting.

Project #14 — Football

Period: September 2021 – August 2022
Role: Unity Developer
Tech Stack: C#, Unity 3D, Jira, Confluence, Git (GitLab), Zenject.
Description: Unreleased football (Soccer) related mobile games.

Responsibilities:

- developing prototypes;
- planning and estimating;
- designing architecture solutions;
- contributing into team workflow;
- cross team code-review;
- documenting.

Project #13 — Slots Era

Period: April 2021 – July 2021
Role: Unity Developer
Tech Stack: C#, Unity 3D, Jira, Confluence, Git (GitLab).
Description: A brand new horizon in the world of Vegas Slot Machines.

Responsibilities:

- assembling new slots by internal tools and written functionality;
- planning and estimating;
- functionality development.

Project #12 — Pinata

Period: September 2020 – March 2021
Role: Game Developer
Tech Stack: C#, Unity 3D – Embedded within Android and iOS, Jira, Confluence, Git.
Description: The small game that engages users to tap Pinata to blow it up and get candies.

Responsibilities:

- coordinating native developers to embed the game;
- planning and estimating;
- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #11 — Belbet

Period: January 2020 – August 2020
Role: Unity Developer
Tech Stack: C#, Unity 3D, Android, iOS, Web, Jira, Confluence, Git.
Description: belbet.by. The new instant belbet lottery is already available on three software platforms – iOS, Android, and Web. The key difference between belbet and other lotteries operating in the country is not only the use of the online platform but also the developed interactive component, the ability to play at any time, as well as non-cash accepting bets and withdrawing funds.

Responsibilities:

- functionality development;
- CI/CD maintenance (TeamCity);
- remote config features;
- new lottery and meta features;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #10 — Domino Master! #1 Multiplayer Game

Period: November 2019 – January 2020
Role: Game Developer
Tech Stack: C#, Unity 3D, Android, iOS, Jira, Confluence, Git.
Description: Google Play, App Store. Domino Master is the first domino app to deliver true multiplayer gameplay for both 2 and 4 player games. From statistic tracking to achievements and rankings, this is the total package. It delivers the perfect blend of 2D and 3D graphics for ease of gameplay and the best user experience, with three challenging levels of play against AI bots.

Responsibilities:

- project documentation;
- communication with client;
- legacy code refactoring, optimization;
- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #9 — Abelana's Atom Maker (Steam)

Period: August 2019 – November 2019
Role: Unity Developer
Tech Stack: C#, Unity 3D, HTC Vive, Steam, Jira, Confluence, Git, Photon (RPC, master client), Unity Physics, Unity SteamVR API, LIV SDK, Localization, Agile.
Description: Visualize atomic orbitals, navigate across energy levels, and gain an intuitive understanding of the composition of atoms and their electron configurations by assembling all elements of the periodic table. An educational VR experience designed for enthusiasts and academics alike. Primarily designed for premium virtual reality platforms such as HTC Vive, Oculus Rift, and Windows Mixed Reality, with potential porting to other platforms.

Responsibilities:

- extracting a part of Virtual Classroom: Atoms and Orbitals project as a standalone module;
- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #8 — Visceral Science: Grasping the universe through virtual reality

Period: March 2019 – August 2019
Role: Unity Developer
Tech Stack: C#, Unity 3D, HTC Vive, Steam, Jira, Confluence, Git, Photon (RPC, master client), Unity Physics, Unity SteamVR API, LIV SDK, Localization, Agile.
Description: abelanavr.com/visceral-science. A VR Education project developed in partnership with The World Science Festival and Columbia University, with support from Verizon Communications. The project leverages 5G technology, combining 5G, VR and education. A class of students and their teacher are immersed in a multiplayer environment where they explore the galaxy and work in teams to understand how stars form, evolve and die. Primarily designed for premium VR platforms such as HTC Vive, Oculus Rift, and Windows Mixed Reality.

Responsibilities:

- functionality development;
- testing and quality assurance;
- teleportation features;
- online multi-user objects interacting features;
- client-server image transfer features;
- high-quality video streaming using 5G network (800 megabits download and 100 megabits upload per second);
- bug-fixing and performance improvement.

Project #7 — Mobile application for VR Classroom

Period: July 2018 – January 2020
Role: Unity Developer
Tech Stack: C#, Unity 3D, Android, iOS, Jira, Confluence, Git.
Description: Assistant app to VR Classroom. The app allows independent mobile access for teachers into a multi-user VR experience and provides a possibility to control the flow of scenes and interact with objects in it. It does not operate as a virtual reality display but supports and enhances a VR session experienced by guests of location-based VR venues, working as a supporting tool for teachers and other presenters.

Responsibilities:

- functionality development;
- extracting base architecture (Core module);
- assets optimization;
- UI building;
- building and publishing iOS and Android;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #6 — VR-in-VR virtual conference of LBVR operators

Period: August 2018 – October 2018
Role: Unity Developer
Tech Stack: C#, Unity 3D, HTC Vive, Steam, Jira, Confluence, Git, Photon (RPC, master client), Unity Physics, Unity SteamVR API, LIV SDK, Localization, Agile.
Description: abelanavr.com/vr-in-vr. The product gives users the experience of participating in a live interactive virtual reality lecture that explores topics such as extra dimensions, the unified theory of physics, and the multiverse. The VR audience engages in the social experience of a worldwide virtual classroom while creating and handling higher-dimensional objects that stretch the bounds of what is possible in a real environment.

Responsibilities:

- functionality development;
- architecture, SDK implementation;
- localization implementation and maintenance;
- client-server communication;
- profiling and optimization;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #5 — Virtual Classroom: Atoms and Orbitals

Period: April 2018 – November 2019
Role: Unity Developer
Tech Stack: C#, Unity 3D, HTC Vive, Steam, Jira, Confluence, Git, Photon (RPC, master client), Unity Physics, Unity SteamVR API, LIV SDK, Localization, Agile.
Description: abelanavr.com/virtual-classroom. A virtual reality experience for learning about Atoms and Orbitals (Chemistry). A multi-user educational experience with gamification and game elements for location-based VR, dedicated to atoms, orbitals, the periodic table of elements, and a variety of tools that bring this conversation to a new level. Features drawing elements for presenter and visitors, VFX scenes, and 3D interactive objects.

Responsibilities:
- functionality development;
- architecture, SDK implementation;
- localization implementation and maintenance;
- client-server communication;
- profiling and optimization;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #4 — Virtual Classroom

Period: March 2018 – April 2018
Role: Unity Developer
Tech Stack: C#, Unity 3D, MS Visual Studio, Git, Jira, Confluence, Photon (RPC, master client).
Description: The product gives users the experience of participating in a live interactive virtual reality lecture that explores topics such as extra dimensions, the unified theory of physics, and the multiverse. The VR audience engages in the social experience of a worldwide virtual classroom while creating and handling higher-dimensional objects.

Responsibilities:
- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #3 — Hungry Arms VR — WoWlab hack TEAM

Period: January 2018
Role: Game Developer
Tech Stack: C#, Unity 3D, MS Visual Studio, Trello.
Description: Non-commercial project. globalgamejam.org/2018/games/hungry-arms-vr. Global-GameJam.

Responsibilities:
- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #2 — SpaceInvaders (hard action game, remake)

Period: December 2017
Role: Game Developer
Tech Stack: C#, Unity 3D, MS Visual Studio, Trello.
Description: Non-commercial project. My remake of the Space Invaders game. Available for macOS and Windows (link). Took 30 hours of work. Source code is available on BitBucket.

Responsibilities:

- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.

Project #1 — Neon Race – "Climb from Lava"

Period: August 2017 – November 2017
Role: Game Developer
Tech Stack: C#, Unity 3D, MS Visual Studio, Trello.
Description: Non-commercial project. youtu.be/AOqWjMk_0Xk. A virtual reality game where the user runs away from the black hole (lava) by climbing huge blocks in space. Some platforms give the user energy to use a grappling hook to pull itself to platforms above and run faster. At the top of each platform, the user jumps to the next one or uses the grappling hook. Later platforms have blockers that can kill the player, so the player uses a shield or moves to other sides of the block. At the end of the level, the player is pulled by gravity through a safe zone and wins the game.

Responsibilities:

- functionality development;
- testing and quality assurance;
- bug-fixing and performance improvement.
